# Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 63 and 74 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wiggs et al., (5,671,608) in view of Aoyagi et al., (6,390,183). Wiggs et al., disclose a direct expansion geothermal heat pump except R410A refrigerant. See Abstract. Aoyagi et al., teach the use of R410 refrigerant in a heat exchanger for the purpose of enhancing heat transfer coefficient and to protect ozone layer. See column 6, lines 46-61, column 7, lines 29-45 and column 16, lines 15-39. Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the direct expansion geothermal heat pump of Wiggs et al., in view of Aoyagi et al., such that R410 refrigerant could be provided in order to run a direct expansion heat pump system. Claims 68 and 79 are rejected under 35 U.S.C. 103(a) as being unpatentable between 50 psi and 180 psi could be provided in order to run a direct

Art Unit: 3744

expansion heat pump system.

Claims 64 and 75 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wiggs et al., (5,671,608) in view of Aoyagi et al., (6,390,183) as applied to claim 63 above and further in view of Suzuki et al., (6,840,058). Wiggs et al., in view of Aoyagi et al., disclose the invention substantially as claimed as stated above. However, Wiggs et al., in view of Aoyagi et al., do not disclose polyolester oils. Suzuki et al., teach the use of polyolester oil as lubricating oil in carbon dioxide refrigerantl system for the purpose of running of the refrigerant control system with a compatible lubricant oil with the carbon dioxide refrigerant. See column 11, lines 14-28. Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the direct expansion geothermal heat pump of Wiggs et al., in view of Aoyagi et al., and further in view of Suzuki et al., such that polyolester oil could be provided in order to run a direct expansion heat pump system with carbon dioxide refrigerant.

Claims 69 and 80 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wiggs et al., (5,671,608) in view of Brasz et al., (6,892,522) as applied to claims 68 and 79 above and further in view of Aoyagi et al. Wiggs et al., in view of Brasz et al., disclose the invention substantially as claimed as stated above. However, Wiggs et al., in view of Brasz et al., do not disclose R410 refrigerant. Aoyagi et al., teach the use of R410 refrigerant in a refrigerant heat exchanging cycle for the purpose of enhancing heat transfer coefficient and to protect ozone layer by using high pressure HFC

Art Unit: 3744

refrigerant. See column 6, lines 8-36. Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the direct expansion geothermal heat pump of Wiggs et al., in view of Brasz et al., and further in view of Aoyagi et al., such that R410 refrigerant could be provided in order to run a direct expansion heat pump system.

Claims 70 and 81 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wiggs et al., (5,671,608) in view of Brasz et al., as applied to claim 68 and 79 above and further in view of Suzuki et al. Wiggs et al., in view of Brasz et al., disclose the invention substantially as claimed as stated above. However, Wiggs et al., in view of Brasz et al., do not disclose polyolester oils. Suzuki et al., teach the use of polyolester oil as lubricating oil in a climate control system for the purpose of running of the climate control system. See column 11, lines 14-28. Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to modify the direct expansion geothermal heat pump of Wiggs et al., in view of Brasz et al., and further in view of Suzuki et al., such that polyolester oil could be provided in order to run a direct expansion heat pump system with carbon dioxide refrigerant.

Allowable Subject Matter

----

Art Unit: 3744

Claims 65, 67, 71, 73, 76, 78, 82 and 84 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

## Response to Arguments

Applicant's arguments, see arguments, filed 02/28/07, with respect to the rejection(s) of claim(s) 64, 70, 75 and 81 under 103 rejection have been fully considered and are persuasive. Therefore, the rejection has been withdrawn. However, upon further consideration, a new ground(s) of rejection is made in view of new prior art.

# Response to Arguments

Applicant's arguments filed 02/28/07 have been fully considered but they are not persuasive against the other claim rejection except the rejections as mentioned above. Applicant argued that the carbon dioxide refrigerant is used in his invention only for gravitational problem in deep well not for the reason of enhancing heat transfer and Ozone layer protection reasons. The examiner disagrees. Other than carbon dioxide (high pressure refrigerant) refrigerant regular refrigerant can also be used in the deep well a pump is necessary during the cooling season to move the liquid refrigerant. Now question arises why carbon dioxide refrigerant is chosen? The answer is, it is cost effective because of enhance heat transfer coefficient. Again if a refrigerant which is not environmentally friendly but suitable for use in deep well as like the carbon dioxide refrigerant without using any pump for DX system refrigerant can be used. The answer would be negative because of its unfriendliness behavior to the environment. Therefore, on the sake of argument and to present an alternative reason to the prime season for

Art Unit: 3744

selecting carbon dioxide refrigerant, the Applicant raised the question of gravitational season for choosing the carbon dioxide refrigerant. But it is not the prime reason, which is stated above. Apart from these, claims are so broad that it does not include any element that the invention relates to a deep well over 50 feet. The claims are also valid for depth of well where there is no gravitational problem and also for regular split type refrigeration system therefore, they can be rejected without considering the gravitational consideration too. The Applicant also mentions that the teachings of air source heat exchanger cannot be used with geothermal (DX) system heat exchanger. Examiner again disagrees. Examiner believes that a teaching of a refrigerant heat exchanger can be conveniently utilized with any other type refrigerant heat exchanger irrespective of it type as geothermal DX, air source or water source. So far The Examiner believes that the Applicant wanted to define a DX system refrigeration as a direct expansion refrigeration system. Examiner finds there is no difference between the definition of Applicant's direct expansion refrigeration system and the regular split type refrigeration system having a compressor, condenser, evaporator and an expansion valve. (See US Patent 6,722,141 to Ferris et al., column 3, lines 13-25; US Patent 5,214,932 to Abdelmalek, lines 8-18 and US Patent 6,427,454 to West, lines 40-43 and lines 58-61). Even though in the case of a nonanalogous art is permissible to use its teachings when the teachings are based on valid ground. In response to applicant's argument leading to a nonanalogous art, it has been held that a prior art reference must either be in the field of applicant's endeavor or, if not, then be reasonably pertinent to the particular problem with which the applicant was concerned, in order to be relied upon as a basis for

Art Unit: 3744

rejection of the claimed invention. See *In re Oetiker*, 977 F.2d 1443, 24 USPQ2d 1443 (Fed. Cir. 1992). In this case, the reference teaches the most relevant subject matter relating to the invention as stated above. Therefore, rejections are proper.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Mohammad M. Ali whose telephone number is 571-272-4806. The examiner can normally be reached on maxiflex.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Cheryl J. Tyler can be reached on 571-272-4808. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
